Executive Summary

Background

The purpose of the Arizona Department of Health Services' HIV Epidemiology Program is to monitor HIV/AIDS trends through case reports and surveillance. There are two methods of surveillance employed by the HIV Epidemiology Program in monitoring HIV/AIDS infections in Arizona: passive and active surveillance. Passive surveillance occurs when health care providers and testing laboratories report notifiable HIV tests/diagnoses to the HIV Epidemiology Program. The majority of HIV/AIDS cases reported in Arizona are through passive surveillance. Active surveillance requires the local health departments to contact health care providers and laboratories requesting information on patients receiving care for HIV. The surveillance data collected is provided to agencies such as the Centers for Disease Control and Prevention (CDC), local health departments, healthcare providers and community organizations to assist in targeting prevention, care and other services.

Definitions and Terms Used

HIV/AIDS Case Definition: See Figure 1. In 2008, the CDC revised the case definition for HIV and AIDS, designating a confirmed case for HIV infection into one of four HIV infection stages (stage 1, stage 2, stage 3 or stage unknown). An AIDS case was designated as stage 3 HIV infection. In 2014, the CDC revised the case definition again in response to changes in diagnostic criteria. An HIV case can be designated stage 0 if there is a negative HIV test within 6 months of the first HIV infection diagnosis. A case can be classified as stage 3 HIV infection if a stage 3 defining opportunistic illness has been diagnosed or immunologic criteria based on a CD4 T-lymphocyte test has been met. For anyone age 6 years through adult, a CD4 T-lymphocyte count less than 200 cells/ μ L, or if the absolute count is missing, a CD4 percentage less than 14% is classified as stage 3 HIV infection.¹ This surveillance report continues to use the term AIDS for stage 3 HIV infections.

Fast Facts

**17,349 Arizonans
have HIV/AIDS**
**730 were newly
infected in 2015**
**191 people with
HIV/AIDS died in
2015**

¹ CDC. Revised Surveillance Case Definition for HIV Infection—United States, 2014. MMWR 2014; 63 (No.RR03; 1-10)

Figure 1

2008 CDC Case Definition for HIV Infection: Summary Table		
Stage	Laboratory Evidence*	Clinical Evidence
Stage 1	Laboratory Confirmation of HIV <i>and</i> CD4 count >500 cells/mm ³ or CD4% ≥29	None required (but no AIDS-defining condition)
Stage 2	Laboratory Confirmation of HIV <i>and</i> CD4 count 200—499 cells/mm ³ or CD4% 14–28	None required (but No AIDS-defining condition)
Stage 3 (AIDS)	Laboratory Confirmation of HIV <i>and</i> CD4 count <200 cells/mm ³ or CD4% <14 [†]	<i>or</i> Documentation of AIDS-defining condition (with laboratory confirmation of HIV infection) [†]
Stage unknown [§]	Laboratory Confirmation of HIV <i>and</i> No information on CD4 cell count or percentage	<i>and</i> No information on presence of AIDS-defining conditions

* The CD4+ T-lymphocyte percentage is the percentage of total lymphocytes. If the CD4+ T-lymphocyte count and percentage do not correspond to the same HIV infection stage, select the more severe stage.

† Documentation of an AIDS-defining condition supersedes a CD4+ T-lymphocyte count of >200 cells/mm³ and CD4+ T-lymphocyte percentage of total lymphocytes of >14.

§ Every effort should be made to report CD4+ T-lymphocyte counts or percentages and the presence of AIDS-defining conditions at the time of diagnosis. Additional CD4+ T-lymphocyte counts or percentages and any identified AIDS-defining conditions can be reported as recommended.

Incidence: HIV/AIDS incidence is the probability of occurrence of HIV/AIDS in a population within a specified period of time, or the number of new cases of HIV/AIDS. The estimates of HIV/AIDS incidence in Arizona are based upon the sum of new HIV cases and new AIDS cases not diagnosed as HIV infections in any prior calendar year. Cases of HIV/AIDS can only be counted as incident in the year they were first diagnosed with HIV infection. Persons who were newly diagnosed as HIV and diagnosed as AIDS in the same calendar year are counted as incident HIV to avoid double counting. This method is the most straightforward method available for estimating incidence.

Prevalence: HIV/AIDS prevalence refers to the total summation of living HIV/AIDS infected cases present in the state at a given time, regardless of the time of infection. A surveillance file is created by the HIV Epidemiology Program for every individual residing in Arizona who is diagnosed with HIV/AIDS. Surveillance files are routinely updated based on additional information obtained from routine healthcare, inter-and intra-state deduplication efforts, and death ascertainment. These updates play a large role in estimating prevalence of HIV/AIDS infections in Arizona. Prevalence estimates may be used for planning efforts or resource allocation, as they reflect the number of individuals residing within an area that need HIV/AIDS care and treatment services.

Incarcerated: Cases designated as incarcerated are individuals whose diagnoses were reported as HIV/AIDS while being housed within the jail/prison system in Arizona. The location of the jail/prison would then be given as the residence of diagnosis. In Pinal County, where the Arizona State Prison Complex – Florence is located, incarcerated individuals infected with HIV make up a significant proportion of cases for that county (Figure 12).

This report includes estimated prevalence and incidence of HIV/AIDS and the 2015 population estimates for each county/region in Arizona.

Table 1 : Arizona Counties' 2014-2015 Population Numbers

County	2014		2015		2014-2015 Growth	
	Count	%	Count	%	Count	%

Arizona Total	6,731,484	100.0%	6,828,065	100.0%	96,581	1.43%

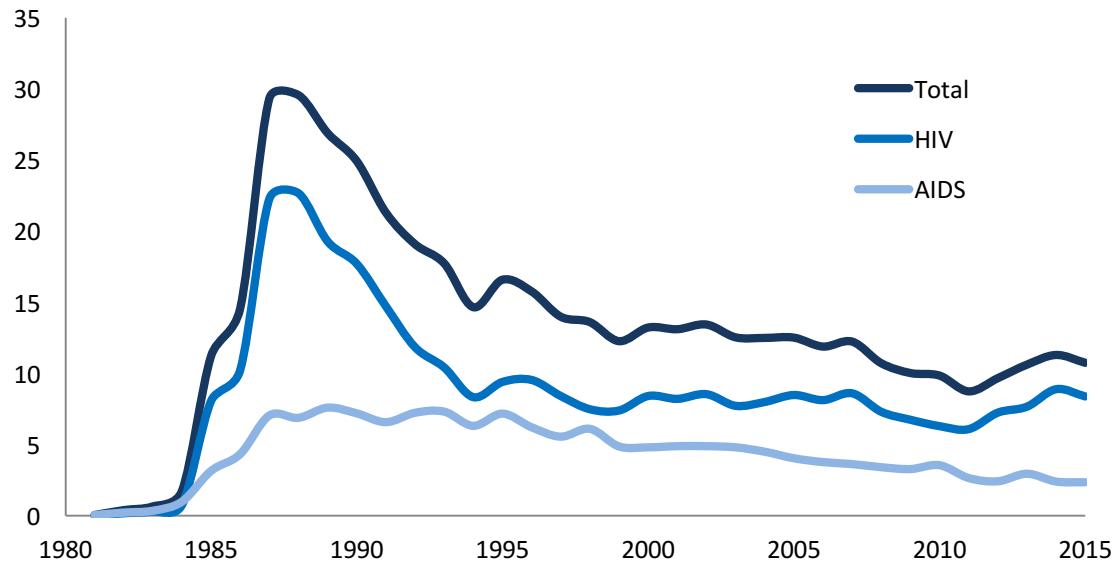

Source : U.S. Census Bureau

Arizona's population has continued to grow as in previous years. Generally, the most populous counties grew at higher rates. The state's population grew by 96,581 from 2014 to 2015 according to the U.S. Census Bureau's estimates (Table 1). This represents an Arizona annual growth rate of 1.43%. The three most populous counties in Arizona, Maricopa (+80,756), Pinal (+4,666), and Pima (+5,509) have the largest increases in terms of absolute numbers. Maricopa (2015: 4,167,947), Arizona's most populous county, has the highest rate of increase (1.98%) while Arizona's least populated county, Greenlee (2015: 9,529), has the second highest rate of increase (1.96%). Five out of the twelve counties in Arizona (Apache, Cochise, Graham, La Paz and Santa Cruz) had decreases in population from 2014 to 2015.

Arizona's HIV/AIDS Epidemic Overview

Figure 1: Arizona HIV/AIDS incidence rate per 100,000, 1980-2015

HIV/AIDS rates declined through the 1990s. By 1999, the rate was 51% lower than in 1990. The rate for 2015 (10.74 per 100,000) is slightly lower than 2014 (11.29 per 100,000).

Figure 2: Arizona HIV/AIDS prevalence counts, 2004-2015

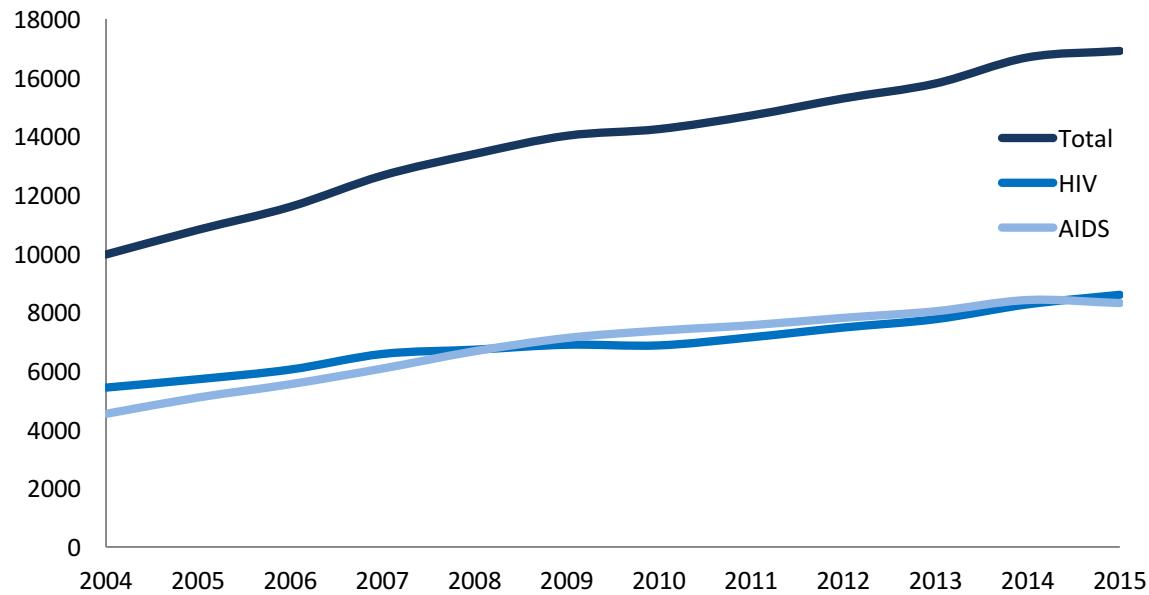

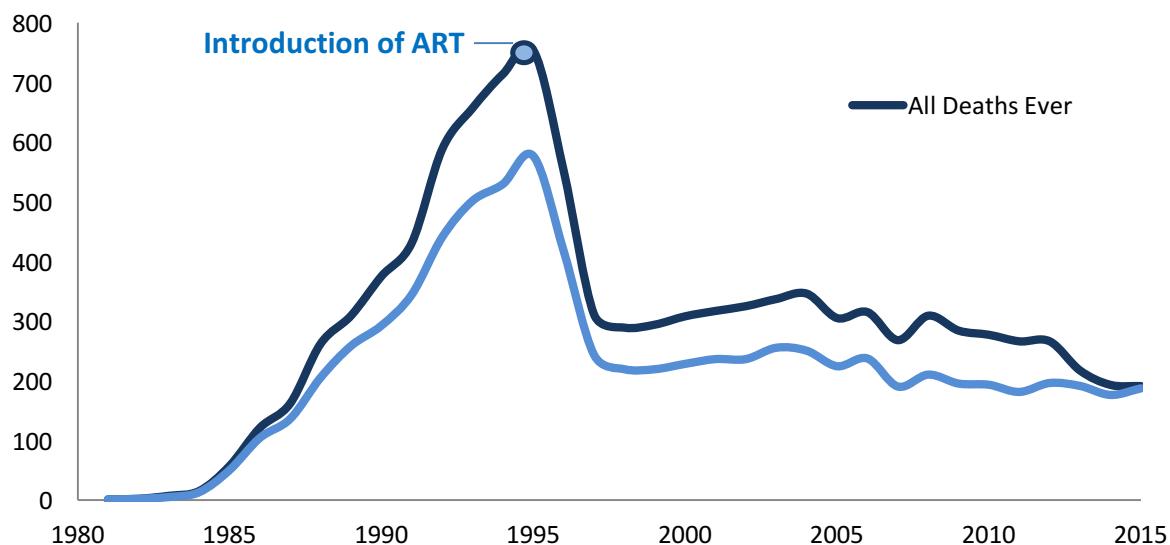

Figure 2 shows the number of HIV/AIDS cases in Arizona from 2004 through 2015. Arizona is currently considered a moderate morbidity state, with CDC-estimated prevalence in the middle rate category among states with well-established confidential name-based HIV/AIDS reporting. Prevalence numbers have continued to rise in Arizona, but this is expected given that people living with HIV/AIDS and taking recommended medications are living longer. At the end of 2015, prevalence of reported HIV infection was 262 cases per 100,000 persons. Currently, in Arizona, which was a population of 6,828,065, there are 17,349 persons living with HIV/AIDS in Arizona. The increase in prevalence rates may be due to the efficacy of multi-drug treatments for HIV infection, which have sharply reduced the number of HIV-related deaths.

Figure 3: Comparison of all Arizona registry cases who died vs those who died in Arizona, 1980-2015

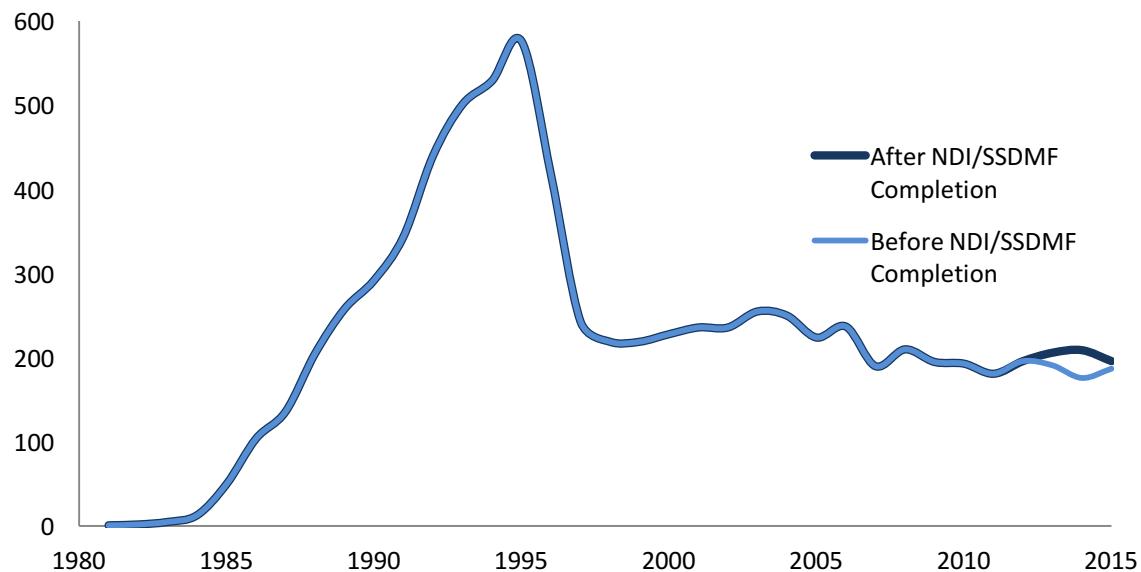

With people migrating in and out of the state regularly, the Arizona HIV/AIDS registry includes those who were have ever resided in Arizona regardless of what state they were diagnosed in. As a result, deaths can be counted as those who ever lived in Arizona, regardless of which state they died in, or to only those who died within the state.

Number of deaths for people living with HIV/AIDS has been decreasing overall since the introduction of antiretroviral therapy (ART) in 1995 (Figure 3). In 2015, 191 deaths were reported for people who are in the Arizona HIV/AIDS registry. Of those deaths, 187 of them actually died in Arizona. (This data is pre-NDI and SSDMF match which is explained on page 8).

Table 2: Comparison of all Arizona registry cases who died vs those who died in Arizona, 1980-2015

2012	266	196
2013	217	191
2014	193	176
2015	191	187

Figure 4: Arizona HIV/AIDS death counts before and after National Death Index/Social Security Death Master File match, 1980-2015

Year	Before NDI/SSDMF	After NDI/SSDMF
2013	191	206
2014	176	209
2015	187	196

HIV/AIDS data is not static. The registry is updated weekly at a minimum. Of special note this year, the National Death Index (NDI) and Social Security Death Master File (SSDMF) were completed to update the database on any deaths that may have occurred throughout the country that weren't necessarily captured by Arizona Vital Statistics. As a result, the number of deaths for the last couple of years increased (Figure 4, lighter blue line and table).

Trends in HIV/AIDS Diagnoses

Sex

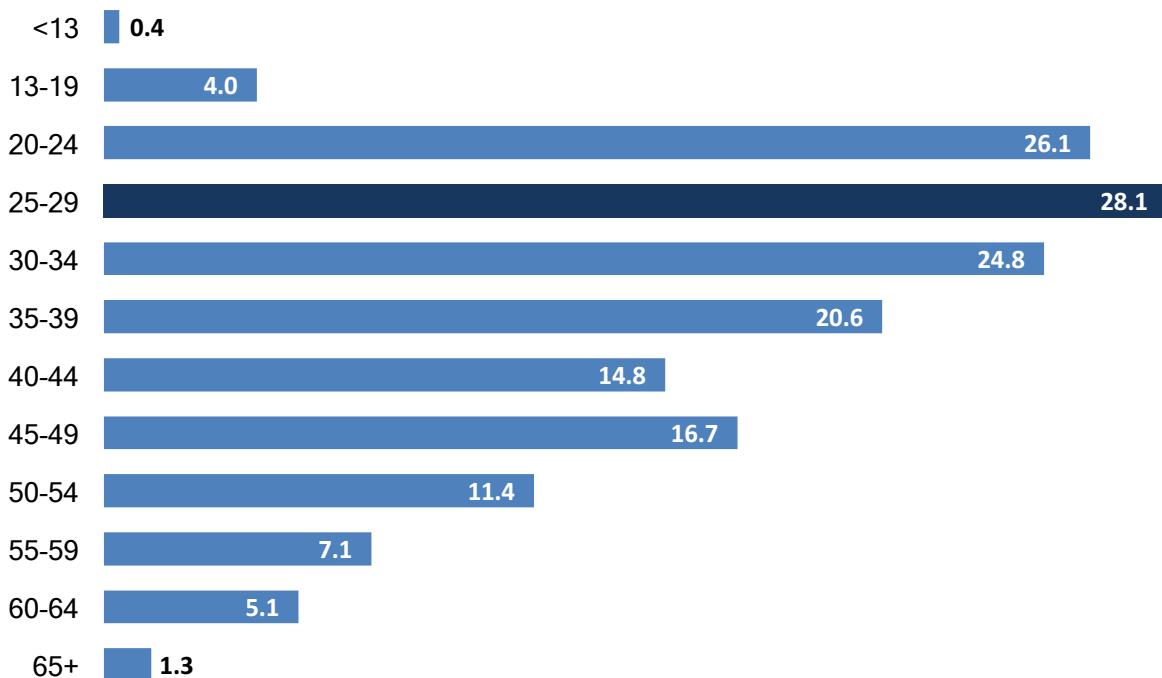

Figure 5: New HIV/AIDS diagnoses rates per 100,000 by sex, 2015

In 2015, men had an HIV/AIDS diagnoses rate of 18.3 per 100,000 while women were diagnosed at a rate of 3 per 100,000 (Figure 5).

Age

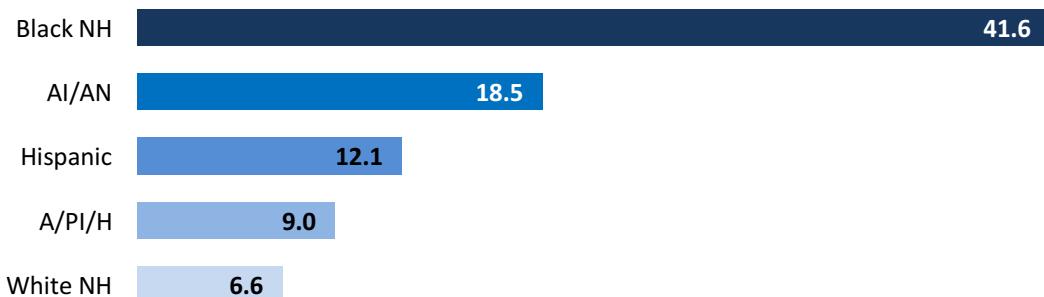

Figure 6: New HIV/AIDS diagnoses rates per 100,000 by age, 2015

People aged 25-29 had the highest HIV/AIDS diagnosis rate in Arizona of 28.1 per 100,000. People aged 20-24 and 30-34 had the second (26.1 per 100,000) and third (24.8 per 100,000) highest HIV/AIDS diagnosis rate, respectively.

Race/Ethnicity

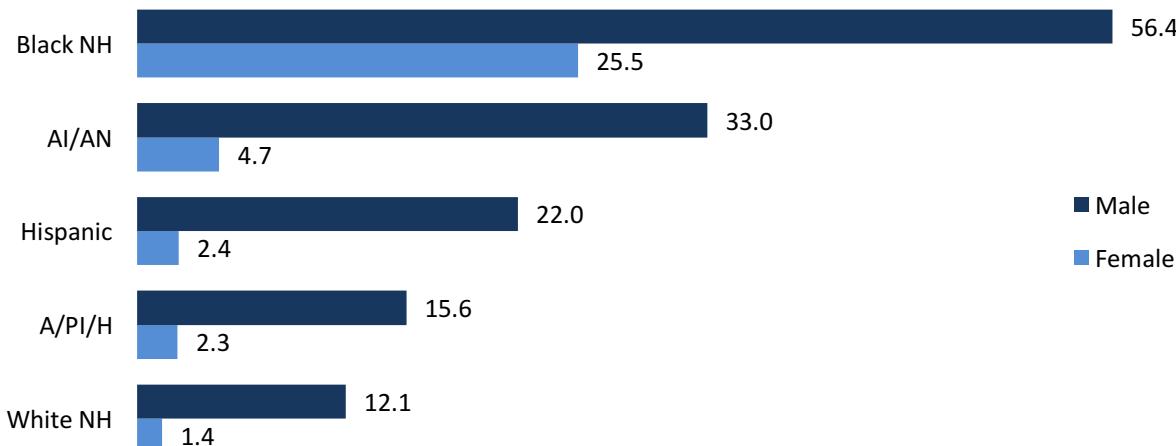

Figure 7: Arizona HIV/AIDS incidence rates per 100,000 by race/ethnicity, 2015

*NH=Non-Hispanic, A/PI/H=Asian/Pacific Islander/Native Hawaiian, AI/AN=American Indian/Alaska Native

HIV/AIDS incidence rates differ sharply between Non-Hispanic Blacks and the rest of the racial/ethnic groups in Arizona. Rates among Non-Hispanic Blacks have almost doubled from 22 per 100,000 in 2010 to 41.6 per 100,000 in 2015 (Figure 7). Non-Hispanic American Indians and Alaska Natives (AI/AN) have the second highest rate of infection of 18.5 per 100,000.

Figure 8: Arizona HIV/AIDS incidence rates per 100,000 by race/ethnicity and sex, 2015

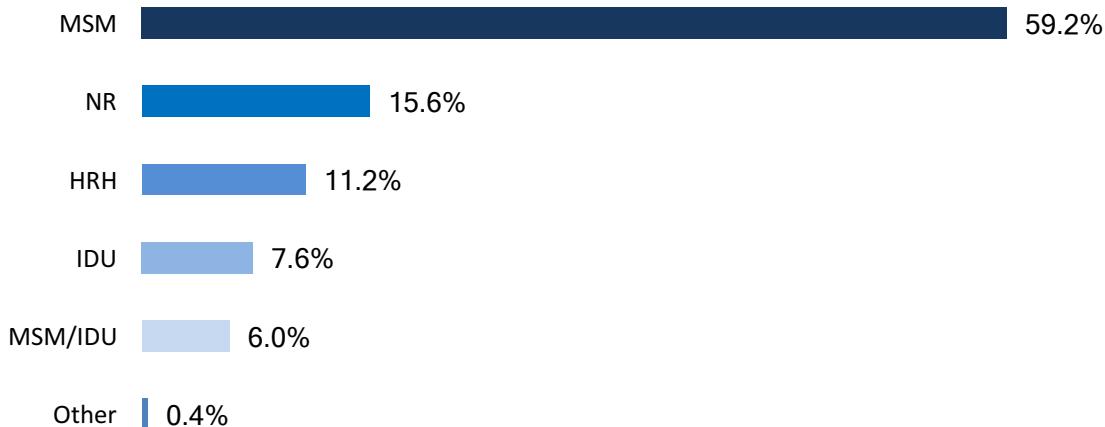

*NH=Non-Hispanic, A/PI/H=Asian/Pacific Islander/Native Hawaiian, AI/AN=American Indian/Alaska Native

Non-Hispanic Blacks are disproportionately affected by HIV/AIDS in Arizona. Non-Hispanic Black males have a diagnosis rate of 56.4 per 100,000 and Non-Hispanic Black females have an incidence rate of 25.5 per 100,000 (Figure 8). American Indians and Alaska Natives are the second most affected group with males having an incidence rate of 33 per 100,000 and females 4.7 per 100,000.

Transmission Categories

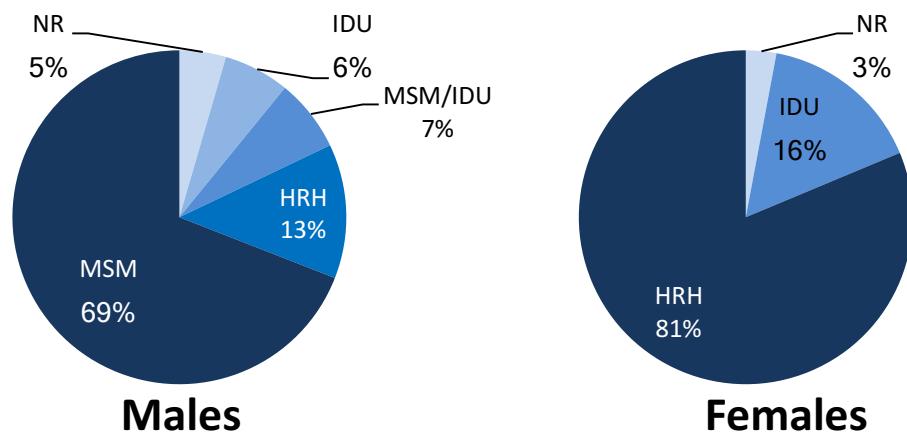

Figure 9: Reported risk categories among new HIV/AIDS diagnoses in Arizona, 2015

*MSM=Men who have sex with men, NR=Not reported, HRH= High-risk heterosexual sex, IDU=Intravenous drug use

Among all the risk groups in Figure 9, men who have sex with men (MSM) account for the largest proportion of incident HIV/AIDS cases in Arizona (59.2%) in 2015. MSM accounts for 69% of all new HIV infections for males, while high-risk heterosexual sex is responsible for 81% of all new HIV infections for females (Figure 10).

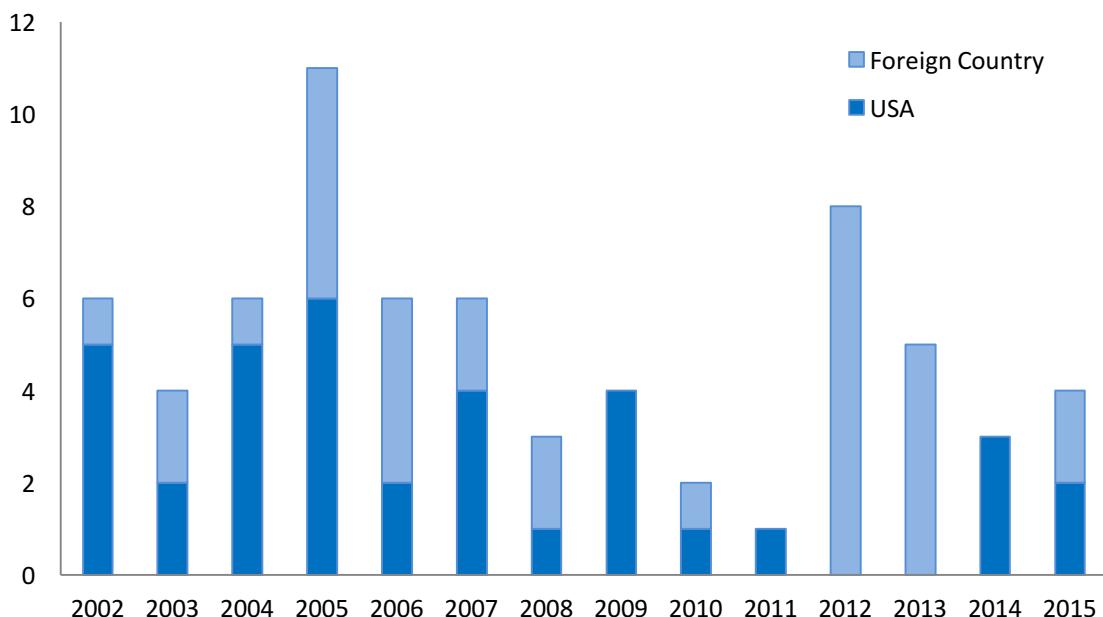

Figure 10: Reported risk categories among new HIV/AIDS diagnoses by sex, 2015

*MSM=Men who have sex with men, NR=Not reported, HRH= High-risk heterosexual sex, IDU=Intravenous drug use

Pediatric HIV Infection

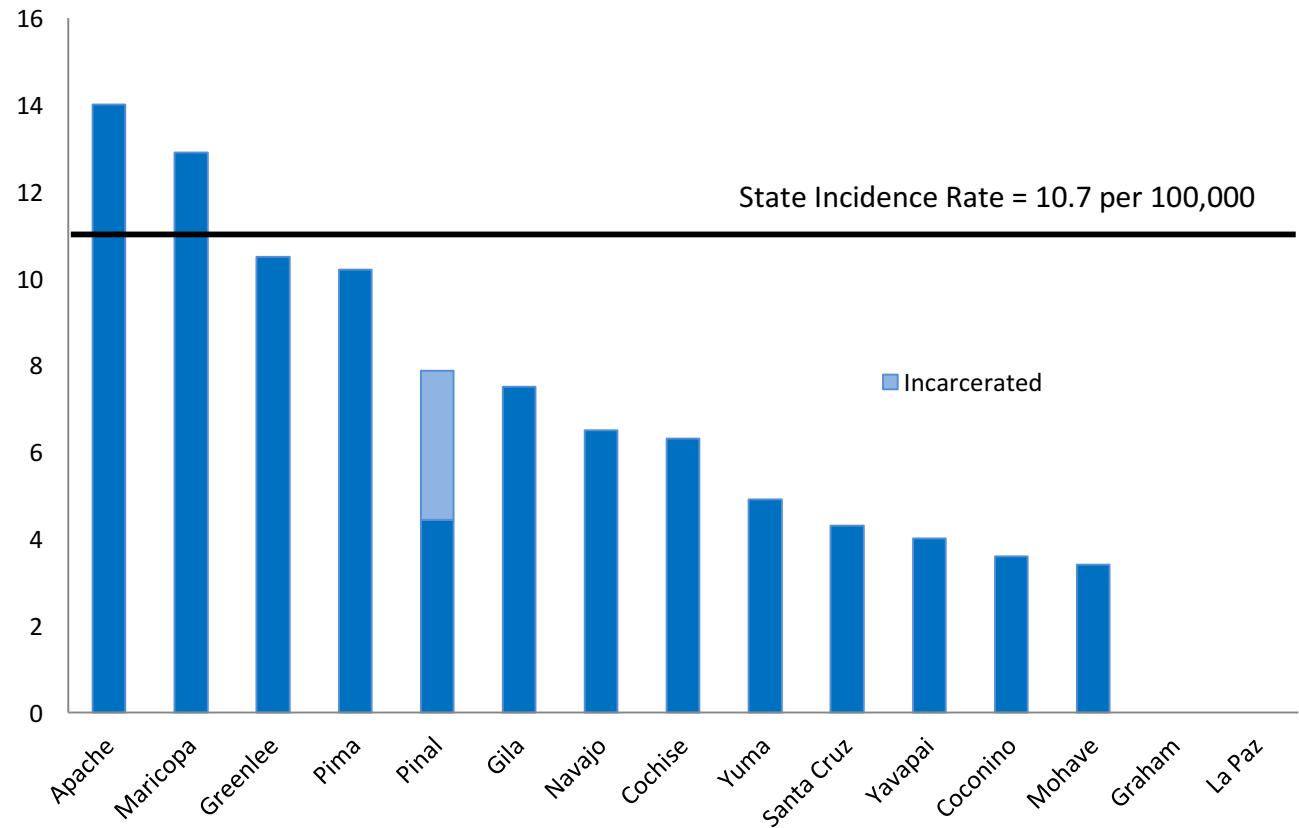

Figure 11: Incident HIV/AIDS cases in Arizona by country of birth in children under age 13, 2002 – 2015

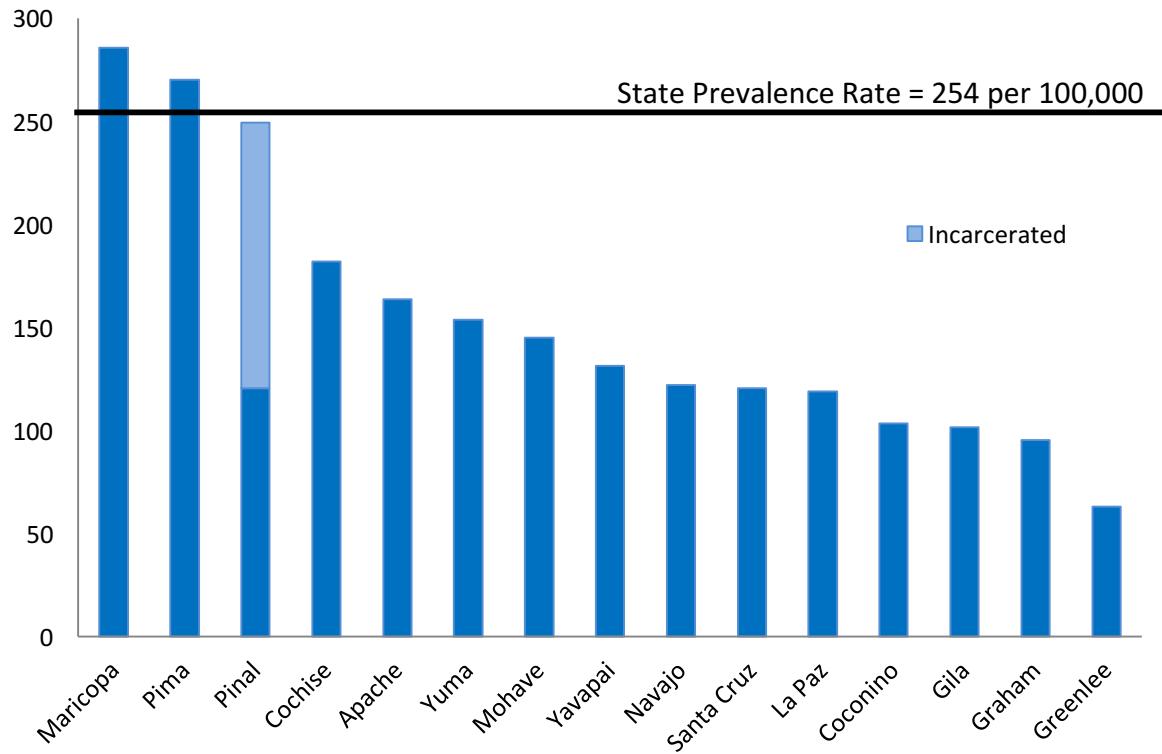

In 2015, there were four cases of incident HIV/AIDS infection among children under age 13 in Arizona, two of whom were U.S.-born and the other two from foreign countries (Figure 11). Since 2002, 33 out of 69 (47.8%) cases under the age of 13 were foreign-born.

County-Specific HIV Infection

Figure 12: Arizona county-specific HIV/AIDS incidence rates, 2015

In 2015, Apache and Maricopa had the highest incidence rates, 14 and 13 per 100,000, respectively (Figure 12).

Figure 13: Arizona county-specific HIV/AIDS prevalence rates, 2015

The majority of the HIV/AIDS prevalence is in the urban counties of Arizona. In 2015, Maricopa and Pima had the highest prevalence rates, 286 and 270 per 100,000, respectively (Figure 13).

HIV/AIDS Continuum of Care

Figure 14: Arizona, 2011-2015

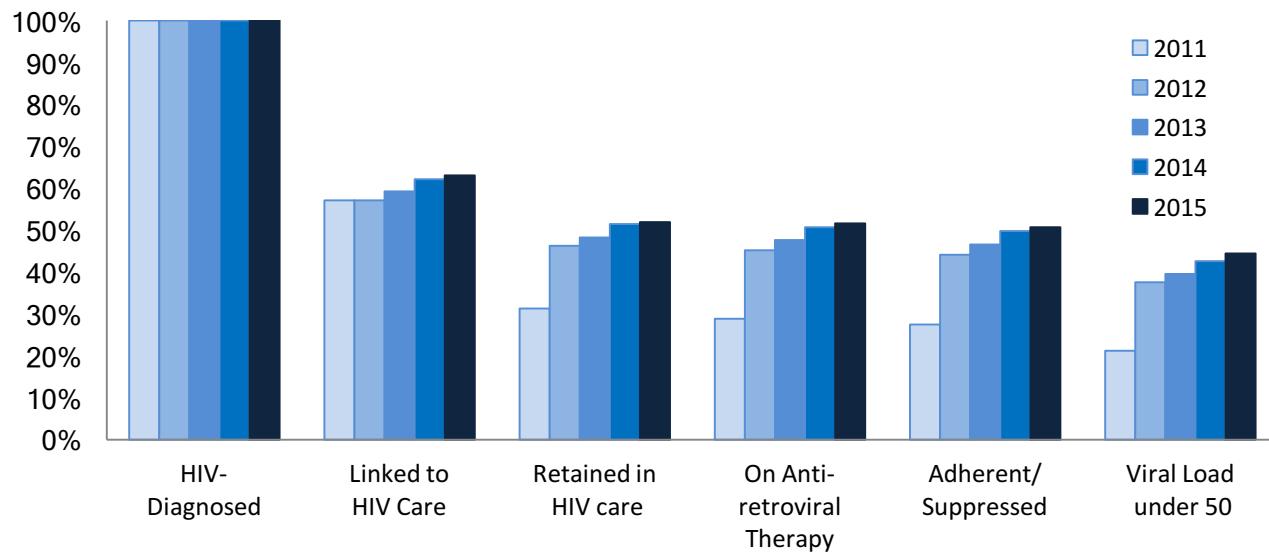

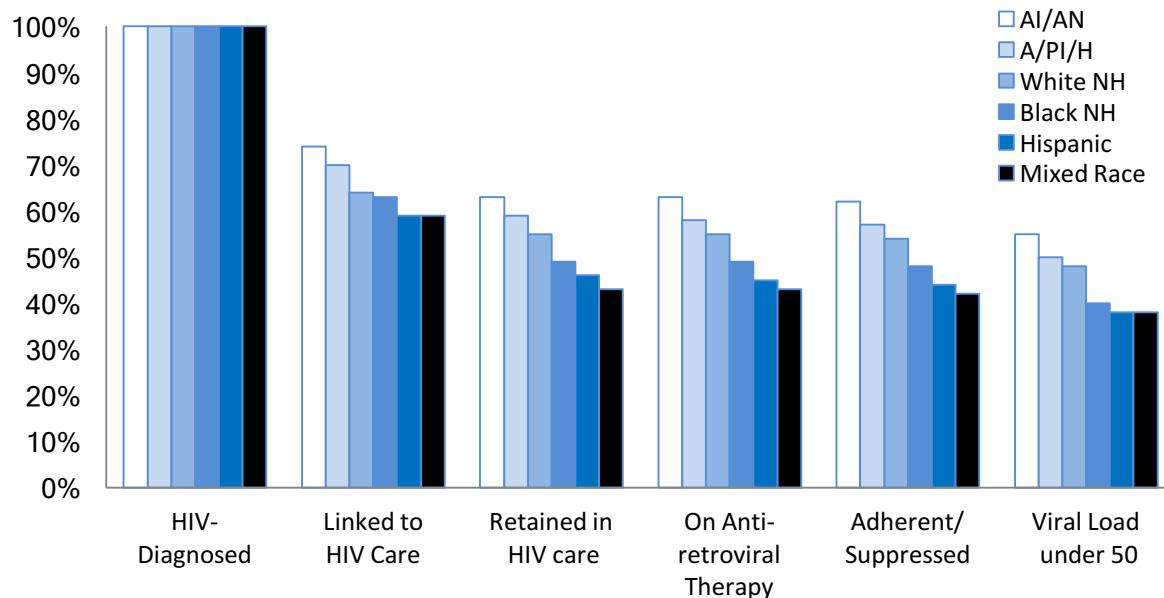

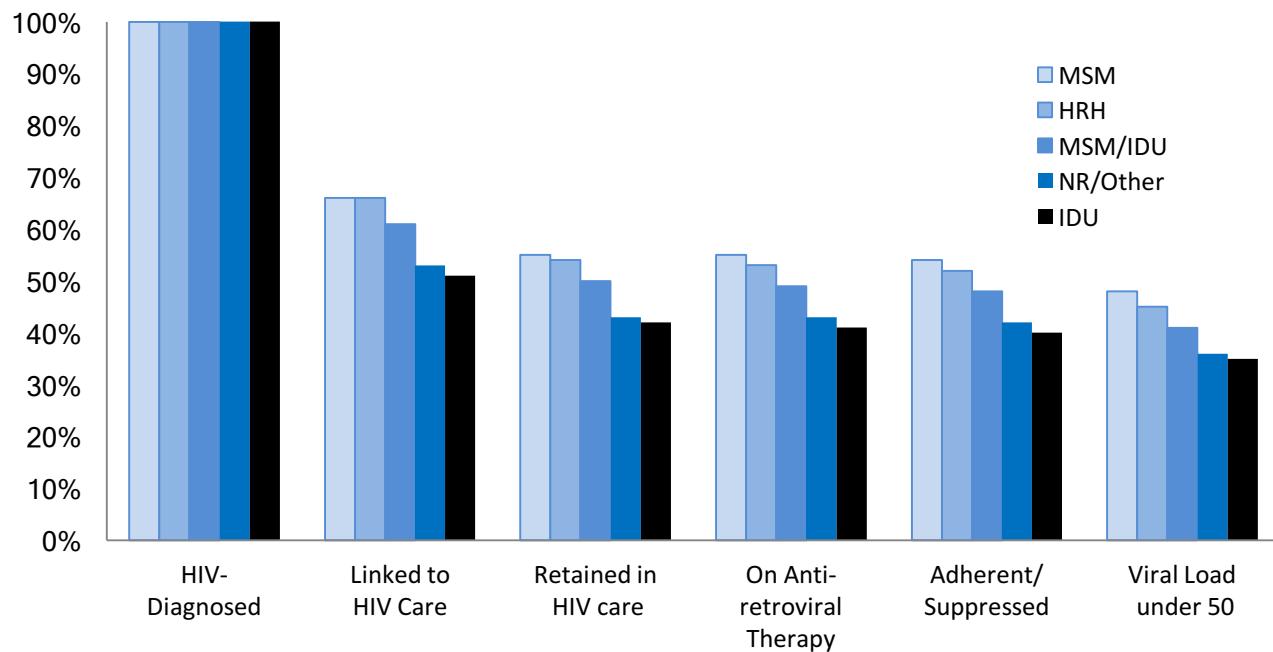

Figure 15: Arizona by Race, 2015

*NH=Non-Hispanic, AI/AN=American Indian/Alaska Native, A/PI/H=Asian/Pacific Islander/Native Hawaiian

Figure 16: Arizona by Transmission Category, 2015

*MSM=Men who have sex with men, NR=Not reported, HRH= High-risk heterosexual sex, IDU=Intravenous drug use

Figures 14-16 display the Spectrum of Care Engagement for Arizona's prevalent cases² by year (2011-2015), race, and transmission category, respectively.

² Spectrum of Care Definitions

HIV-Diagnosed : Prevalent cases.

Linked to HIV Care: Prevalent cases with a documented lab test, doctor visit or medication use in the calendar year.

Retained in HIV Care: Prevalent cases with a documented lab test, doctor visit or anti-retroviral (ARV) use in the first 6 months of the calendar year and the second 6 months of the calendar year or one documented lab test, doctor visit or ARV use in the calendar year with a lab result indicating viral suppression status.

On ARV Therapy: Prevalent cases with documented ARV use or whose last viral load of the calendar year was undetectable. All "Adherent/Suppressed" are in this category.

Adherent/Undetectable: Prevalent cases whose last viral load of the calendar year was suppressed (<200 C/mL).
