

Weekly Influenza Summary:

No new cases of influenza were reported for Arizona during the previous two weeks (weeks 25 & 26). ADHS will continue to conduct surveillance and investigate all suspected cases for influenza in the following months. The influenza-like-illness rate is higher than the state baseline for weeks 24 and 25.

Data in this report are provisional and may change as more reports are received.

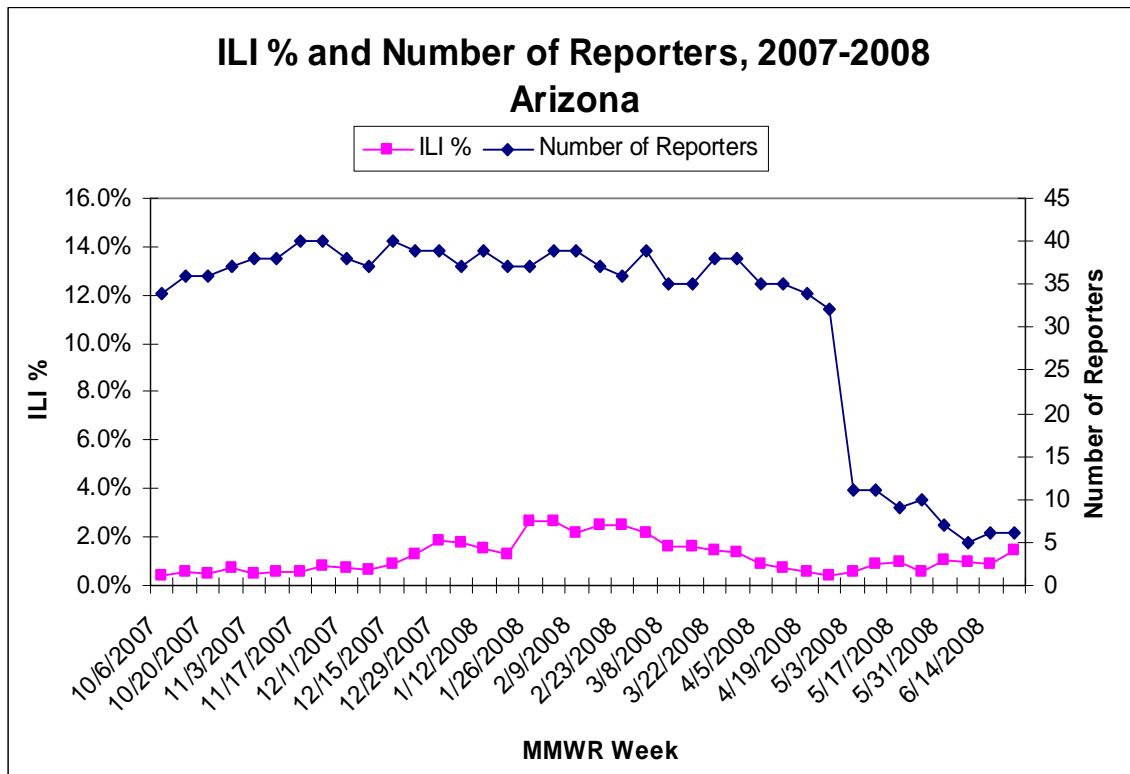

National influenza surveillance data are available at the CDC’s Influenza Surveillance site (<http://www.cdc.gov/flu/weekly/fluactivity.htm>).

Influenza-Like Illness (ILI) Surveillance from Sentinel Providers

The proportion of patient visits to sentinel providers for ILI in the state was 0.9% for the week ending 6/14/2008 (week 24) and 1.4% for the week ending 6/21/2008 (week 25). Both of the respective values are higher than the Arizona ILI baseline (0.5%). As of 6/30/08, 6 sentinel providers reported by the end of week 24 and week 25 respectively. It is important to note that participation among the sentinel providers decline significantly during the summer months or during the non-peak influenza activity months. Therefore, the noted ILI proportion may not be representative for the entire state of Arizona.

ILI is defined as a fever of at least 100°F plus either a cough or a sore throat.

RSV Activity in Arizona:

As of 6/30/2008, 2,316 lab-confirmed cases have been reported. There were 2 new cases of RSV reported during the weeks of 25 and 26.
