Unintentional Falls were the leading cause of injury-related mortality among Arizona residents 65 years and older.

Among 2013 hospitalizations and emergency department visits:
⇒ The average length of stay in the hospital was 4 days
⇒ The median charges for inpatient visits were $47,280, and totaled over $624.8 million ($9.2 million were charged to AHCCCS)
⇒ ED visits resulted in charges totaling over $204.1 million ($1.9 million were charged to AHCCCS)
⇒ These charges do not describe costs associated with physician care, EMS services, rehabilitation, or long-term disability.

What can be done to reduce the risk of unintentional falls?
* Maintain a regular exercise program to increase strength, balance, and coordination. Tai Chi classes are an evidence-based method.
* Regularly review medications with a healthcare provider, and safely dispose of prescriptions that are no longer needed.
* Have yearly eye exams.
* Modify home environments to reduce hazards such as slippery floors, poor lighting, and uneven surfaces.
