How much arsenic is too much arsenic?

Arizona Department of Health Services has developed a simple method to determine if arsenic levels are too high by using the color code below.

* ppb is parts per billion and mg/L is milligrams per liter.

- **Above 200 ppb or 0.2 mg/L**: This water should not be used for drinking or cooking! You should obtain your drinking water from another source immediately, or install and maintain a home treatment device.
- **11-200 ppb or 0.011-0.2 mg/L**: This water will increase the risk of long term or chronic health problems. Don’t panic! Remember, chronic conditions develop over a long time. Make plans to obtain water from another source or install and maintain treatment.
- **Less than 10 ppb or 0.01 mg/L**: It is ok to drink and cook with this water.

In addition to the schedule above, have your well tested if:

- There are known problems with well water in your area
- You have experienced problems near your well (flooding, wildfire, land disturbances)
- You notice a change in water quality (taste, color, odor)
- Anyone in your family has an unexplained illness
